QUESTION 201 Hotspot Question Your network contains an Active Directory forest named contoso.com. The forest contains a single domain. The contoso.com zone is Active Directory-integrated and configured to replicate to all of the domain controllers in the contoso.com domain. Server1 has a DNS record in the contoso.com zone. You need to verify when the DNS record for Server1 was last updated. In which Active Directory partition should you view the DNS record of Server1? To answer, select the appropriate Active Directory partition in the answer area.

Answer:

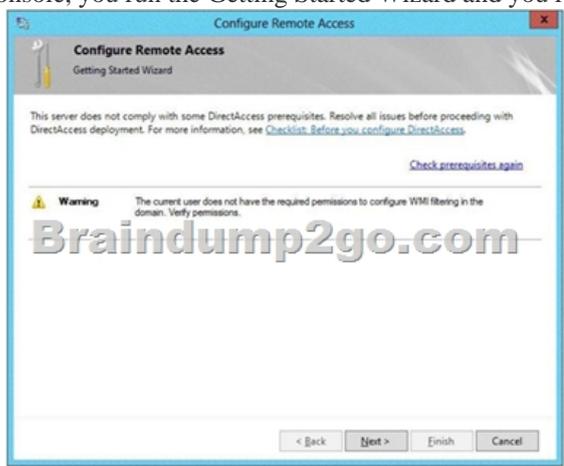

QUESTION 202 Your network contains an Active Directory domain named contoso.com. The domain contains two member servers named Server1 and Server2. All servers run Windows Server 2012 R2. Server1 has the Windows Server Update Services (WSUS) server role installed. WSUS is configured to use a Windows Internal Database. Server2 has Microsoft SQL Server 2008 R2 Standard deployed. You detach the SUSDB database from Server1 and attach the database to Server2. You need to ensure that Windows Deployment Services (WDS) on Server1 uses the database hosted on Server2. What should you do on Server1? A. Configure an ODBC file data source. B. Run the wsutil command. C. Edit the registry. D. Configure an ODBC system data source. Answer: C Explanation: Find the following key: HKLM\SOFTWARE\Microsoft\UpdateServices\ServerSetup\SqlServerName. In the Value data box, type [BENAME][InstanceName], and then click OK. If the instance name is the default instance, type [BENAME]. Find the following key: HKLM\Software\Microsoft\Update Services\ServerSetup\YukonInstalled. In the Value box, type 0, and then click OK. [http://technet.microsoft.com/en-us/library/cc708558\(WS.10\).aspx](http://technet.microsoft.com/en-us/library/cc708558(WS.10).aspx) QUESTION 203 Your network contains an Active Directory forest named contoso.com. The functional level of the forest is Windows Server 2008 R2. All of the user accounts in the marketing department are members of a group named ContosoMarketingUsers. All of the computer accounts in the marketing

department are members of a group named ContosoMarketingComputers. A domain user named User1 is a member of the ContosoMarketingUsers group. A computer named Computer1 is a member of the ContosoMarketingComputers group. You have five Password Settings objects (PSOs). The PSOs are defined as shown in the following table.

Password setting	Directly applies to	Precedence	Minimum password length
PSO1	Contoso\Domain Users	16	14
PSO3	Contoso\MarketingComputers	10	12
PSO5	User1	1	10

When User1 logs on to Computer1 and attempts to change her password, she receives an error message indicating that her password is too short. You need to tell User1 what her minimum password length is. What should you tell User1? A. 10 B. 11 C. 12 D. 14
Answer: A
Explanation: Let's take the G_ITAdmins group and apply two PSOs, one with precedence of 10 and one with precedence of 5. The PSO with precedence of 5 will win, because a lower precedence value is a higher precedence. This makes sense if you are just using groups and apply the PSO to the group level. But what happens if you apply a PSO to the group G_ITAdmins (Sally Smith is still a member) and you apply a PSO directly to Sally Smith? Let's take the G_ITAdmins group again, where Sally Smith is a member, and apply a PSO with a precedence of 10. Create another PSO with a precedence of 15 and apply this PSO directly to the user Sally Smith. The PSO directly applied to Sally will win, although the precedence value is higher. The way that the PSO applied is determined is as follows: A PSO that is linked directly to the user object is the resultant PSO. If no PSO is linked to the user object, the global security group memberships of the user - and all PSOs that are applicable to the user based on those global group memberships - are compared. The PSO with the lowest precedence value is the resultant PSO.

<https://technet.microsoft.com/en-us/library/cc770394%28v=ws.10%29.aspx> QUESTION 204 Your network contains an Active Directory domain named contoso.com. The domain contains a server named Server1 that runs Windows Server 2012 R2. Server1 has the Remote Access server role installed. You log on to Server1 by using a user account named User2. From the Remote Access Management Console, you run the Getting Started Wizard and you receive a warning message as shown in the exhibit. (Click the Exhibit button.)

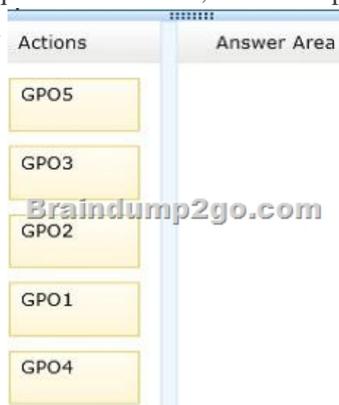

You need to ensure that you can configure DirectAccess successfully. The solution must minimize the number of permissions assigned to User2. To which group should you add User2? A. Enterprise Admins B. Administrators C. Server Operators D. Account Operators
Answer: B
Explanation: You must have privileges to create WMI filters in the domain in which you want to create the filter. Permissions can be changed by adding a user to the Administrators group. Administrators (A built-in group) After the initial installation of the operating system, the only member of the group is the Administrator account. When a computer joins a domain, the Domain Admins group is added to the Administrators group. When a server becomes a domain controller, the Enterprise Admins group also is added to the Administrators group. The Administrators group has built-in capabilities that give its members full control over the system. The group is the default owner of any object that is created by a member of the group. This example logs in as a test user who is not a domain user or an administrator on the server. This results in the error specifying that DA can only be configured by a user with local administrator permissions. [http://technet.microsoft.com/en-us/library/cc780416\(v=ws.10\).aspx](http://technet.microsoft.com/en-us/library/cc780416(v=ws.10).aspx) [http://technet.microsoft.com/en-us/library/cc775497\(v=ws.10\).aspx](http://technet.microsoft.com/en-us/library/cc775497(v=ws.10).aspx) QUESTION 205 Your company has a main office and a branch office. The network contains an Active Directory domain named contoso.com. The main office contains a domain controller named

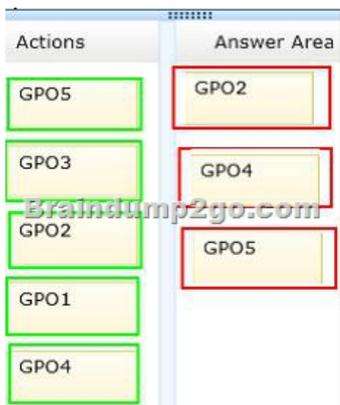

DC1 that runs Windows Server 2012 R2. DC1 is a DNS server and hosts a primary zone for contoso.com. The branch office contains a member server named Server1 that runs Windows Server 2012 R2. Server1 is a DNS server and hosts a secondary zone for contoso.com. The main office connects to the branch office by using an unreliable WAN link. You need to ensure that Server1 can resolve names in contoso.com if the WAN link is unavailable for three days. Which setting should you modify in the start of authority (SOA) record? A. Retry interval B. Minimum (default) TTL C. Refresh interval D. Expires after Answer: D
Explanation: Refresh interval. Used to determine how often other DNS servers that load and host the zone must attempt to renew the zone. Retry interval. Used to determine how often other DNS servers that load and host the zone are to retry a request for update of the zone each time that the refresh interval occurs. Expire interval. Used by other DNS servers that are configured to load and host the zone to determine when zone data expires if it is not renewed. QUESTION 206 Your network contains an Active Directory domain named contoso.com. The domain contains a server named Server1 that runs Windows Server 2012 R2. Server1 has the Network Policy and Access Services server role installed. You plan to deploy 802.1x authentication to secure the wireless network. You need to identify which Network Policy Server (NPS) authentication method supports certificate-based mutual authentication for the 802.1x deployment. Which authentication method should you identify? A. PEAP-MS-CHAP v2 B. MS-CHAP v2 C. EAP-TLS D. MS-CHAP Answer: C
Explanation: 802.1X uses EAP, EAP-TLS, EAP-MS-CHAP v2, and PEAP authentication methods: EAP (Extensible Authentication Protocol) uses an arbitrary authentication method, such as certificates, smart cards, or credentials. EAP-TLS (EAP-Transport Layer Security) is an EAP type that is used in certificate-based security environments, and it provides the strongest authentication and key determination method. EAP-MS-CHAP v2 (EAP-Microsoft Challenge Handshake Authentication Protocol version 2) is a mutual authentication method that supports password-based user or computer authentication. PEAP (Protected EAP) is an authentication method that uses TLS to enhance the security of other EAP authentication protocols. QUESTION 207 Your network contains an Active Directory domain named contoso.com. AH servers run Windows Server 2012 R2. The domain contains a server named Server1. You install the Windows PowerShell Web Access gateway on Server1. You need to provide administrators with the ability to manage the servers in the domain by using the Windows PowerShell Web Access gateway. Which two cmdlets should you run on Server1? (Each correct answer presents part of the solution. Choose two.) A. Set-WSManQuickConfig B. Set-WSManInstance C. Add-PswaAuthorizationRule D. Set-BCAuthentication E. Install-Pswa Web Application Answer: CE QUESTION 208 Drag and Drop Question Your network contains an Active Directory domain named contoso.com. All domain controllers run Windows Server 2012 R2. The domain contains an organizational unit (OU) named OU1. OU1 contains an OU named OU2. OU2 contains a user named User1. User1 is the member of a group named Group1. Group1 is in the Users container. You create five Group Policy objects (GPO). The GPOs are configured as shown in the following table.

GPO name	Linked to
GPO1	Contoso.com
GPO2	Contoso.com
GPO4	OU1
GPO5	OU2

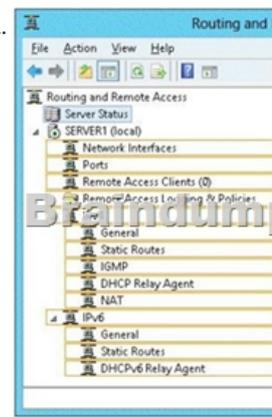

You need to identify which three GPOs will be applied to User1 and in which order the GPOs will be applied to User1. Which three GPOs should you identify in sequence? To answer, move the appropriate three GPOs from the list of GPOs to the answer area and arrange them in the correct order.

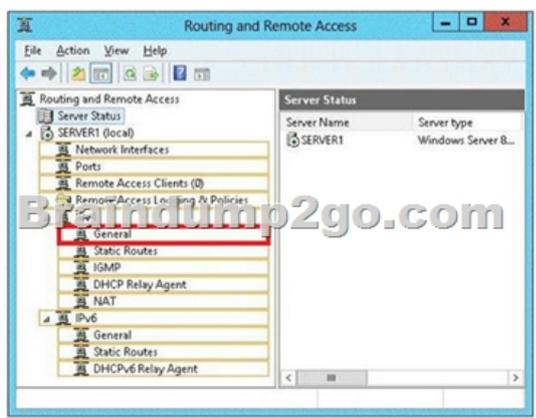

Answer:

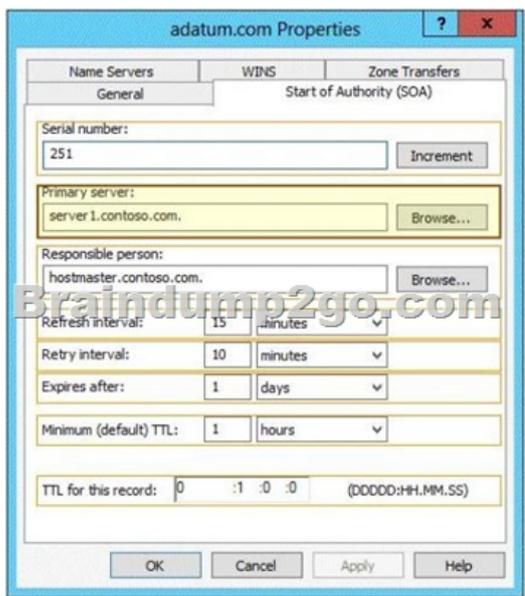

QUESTION 209 Hotspot Question You have a server named Server1 that runs Windows Server 2012 R2. Server1 has two network adapters and is located in a perimeter network. You need to install the RIP version 2 routing protocol on Server1. Which node should you use to add the RIP version 2 routing protocol? To answer, select the appropriate node in the answer area.

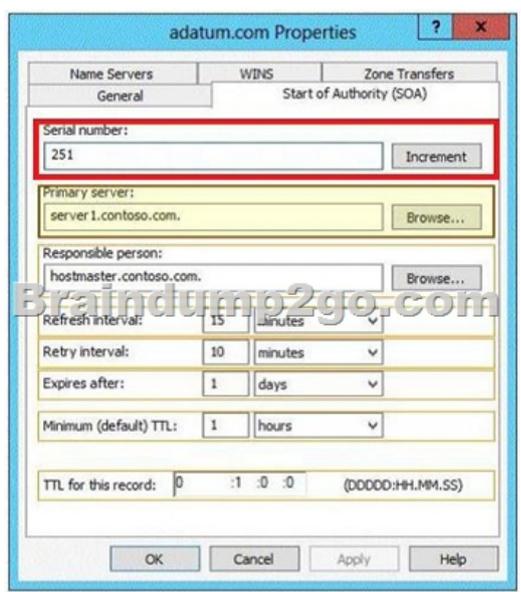

Answer:

QUESTION 210 Hotspot Question Your network contains an Active Directory domain named contoso.com. All DNS servers host a DNS zone named adatum.com. The adatum.com zone is not Active Directory-integrated. An administrator modifies the start of authority (SOA) record for the adatum.com zone. After the modification, you discover that when you add or modify DNS records in the adatum.com zone, the changes are not transferred to the DNS servers that host secondary copies of the adatum.com zone. You need to ensure that the records are transferred to all the copies of the adatum.com zone. What should you modify in the SOA record for the adatum.com zone? To answer, select the appropriate setting in the answer area.

Answer:

Want to be 70-411 certified? Using Braindump2go New Released 70-411 Exam Dumps Now! We Promise you a 100% Success Passing Exam 70-411 Or We will return your money back instantly!
